

Our goal is to maximize the valley  
of a path starting from  $(0,0)$

Define:  $\text{valley}(\text{path}) = \min(\text{each step's sum in the path})$

$\text{dp}[i][j]$  (Among all paths from  $(i,j)$  toward the goal).

$= \max_{\text{path} \in \text{paths toward goal}} (\text{valley}(\text{path}))$

$\text{dp}[i][j] = \min(\underbrace{\text{map}[i][j]}_{\text{itself can become a valley}}, \text{map}[i][j] + \max(\text{dp}[i+1][j], \text{dp}[i][j+1]))$

return if  $\text{dp}[0][0] \geq 0$ , output 1  
else output  $(-\text{dp}[0][0] + 1)$

Illustration:

$(i, j+1) \rightsquigarrow \text{goal}$

adding  $\text{map}[i][j]$  will look like:

If  $\text{map}[i][j] \geq 0$

↑ means the whole path  
is shifted up by  $\text{map}[i][j]$

If  $\text{map}[i][j] < 0$ , the whole path will be  
shifted down

By adding  $(i, j)$ , the new valley can only be

①  $\text{map}[i][j]$   
or  
②  $\max \left( \begin{array}{l} \boxed{\text{map}[i][j] + \text{dp}[i][j+1]}, \\ \text{map}[i][j] + \text{dp}[i+1][j] \end{array} \right)$   
↳ shift the path's value by  $\text{map}[i][j]$
